Comments on protocol:

Protocol may work with other DNA extraction methods. Allele Description: The mouse R565Q model was created using optimized CRISPR Cas9 KI technology utilizing Ribonucleoprotein (RNP) in the presence of a synthetic single strand DNA repair template harboring the desired KI. Zygotes were electroporated and subsequent progeny were screened for the presence of the correctly targeted allele via homology directed repair (HDR). The KI nucleotides disrupt the PAM site (nGG) and are 4 and 5 bp from cleavage site and engineered into ssODN to protect the HDR derived locus from auto-cutting by Cas9. Key progeny were sequence confirmed.
